STRUCON — SEO Strategy & Implementation Report

Target: Global EPC market · **Primary intent:** commercial (lead-gen), not just traffic. This documents how SEO is engineered into the build, stage by stage. Items marked ✅ are implemented in **Stage 1**; ⏳ are wired-for and completed in later stages.

1. Keyword strategy — commercial intent over raw volume

Per your brief, we target buyer-intent phrases a decision-maker types when they're ready to hire, not broad informational terms. Mapped to pages so each URL owns a small keyword cluster:

PAGE	PRIMARY KEYWORD	SUPPORTING KEYWORDS
Home	Structural Engineering Consultant	Steel Detailing Company, EPC Engineering Design, Industrial Engineering Consultants
/services/steel-detailing	Steel Detailing Company	Tekla Modeling Services, Fabrication Drawing Services, Connection Design
/services/bim	Structural BIM Services	Tekla BIM, Clash Detection Services
/services/structural-engineering	Power Plant Structural Design	Pipe Rack Design, Industrial Steel Structures
/industries/power	Power Plant Structural Design	Boiler Structure Detailing
/industries/mining	Conveyor Gallery Design	Transfer Tower Design
/industries/oil-gas	Pipe Rack Design	Process Structure Detailing
Blog posts	long-tail informational	funnel top → capture → retarget

The keyword bank lives in `src/lib/seo.ts` (`keywordBank`) and is attached per-page via `buildMetadata()`.

2. On-page & technical SEO

ITEM	STATUS	WHERE
Unique `<title>` + meta description per page	✅ (home) / ⏳ (all)	`buildMetadata()` in `src/lib/seo.ts`
Canonical URLs	✅	`alternates.canonical` in every page's metadata
Semantic heading hierarchy (one `<h1>`, ordered `<h2/h3>`)	✅	Hero `<h1>`, `Section` `<h2>`, cards `<h3>`
Open Graph + Twitter cards	✅	`buildMetadata()`
`sitemap.xml` (auto-generated, content-driven)	✅	`src/app/sitemap.ts`
`robots.txt` (+ sitemap ref, admin/api disallowed)	✅	`src/app/robots.ts`
Descriptive, keyword-relevant URL slugs	✅	`/services/steel-detailing`, `/industries/power` …
Image `alt` text everywhere	✅	`MediaFrame` requires `alt`; `next/image` enforced
Internal linking (nav, cards, footer, cross-links)	✅	Services/Industries/Projects grids all deep-link
Breadcrumbs + BreadcrumbList schema	⏳ Stage 2–3	on sub-pages
`hreflang` (only if we add localized pages)	⏳ if needed	—

3. Structured data (schema.org / JSON-LD)

SCHEMA	STATUS	WHERE
`Organization`	✅	`src/lib/schema.ts` → rendered in root layout
`ProfessionalService` / `LocalBusiness` (address, geo, areaServed: Worldwide)	✅	same
`Service` (per service page)	⏳ Stage 2	
`Article` + author/date (per blog post)	⏳ Stage 5	
`BreadcrumbList`	⏳ Stage 2–3	
`FAQPage` (service-page FAQs)	⏳ Stage 2	eligible for rich results

4. Performance = ranking (Core Web Vitals)

Google ranks on CWV; the stack is built to hit **95+ Lighthouse**:

- **Next.js App Router + React Server Components** — minimal client JS (only the Navbar and Reveal wrapper are client components).
- **Fonts self-hosted** via `next/font` (no render-blocking Google Fonts request; `display: swap`).
- **Images** via `next/image` with AVIF/WebP, responsive `sizes`, lazy-loading below the fold.
- **LCP:** hero text is server-rendered HTML (not an image), so the largest paint is instant; hero video is decorative and never the LCP element.
- **CLS:** fixed aspect-ratio media frames + reserved space → no layout shift.
- **No heavy libraries:** the "world map" is inline SVG/CSS, not a map/tiles library.
- `prefers-reduced-motion` respected; animations are CSS transforms (compositor-friendly).

> ⚠️ CWV caveat: once you supply the **hero video**, keep it ≤ ~2–3 MB, compressed (H.264/H.265), muted, and lazy — a heavy video is the one thing that can sink the mobile score. A high-quality poster image + short loop is the safe pattern.

---

5. Off-page & operational (your side — for later)

- Google Business Profile for the Noida HQ (feeds LocalBusiness).
- Google Search Console + GA4 (I'll add the tags in Stage 6 once you share IDs).
- Consistent NAP (Name, Address, Phone) across directories.
- Backlinks from EPC partners, association listings, and published project references.

---

6. What I still need from you for full SEO (see REQUIREMENTS.md)

1. **Production domain** — canonicals/sitemap currently use `www.strucon.net`.
2. **GA4 + Search Console** access/IDs.
3. **OG share image** (1200×630) — or I'll generate a branded default.
4. Confirmation of **priority service/industry pages** so I weight internal linking + metadata.
